

The Geoengineering and Underground Construction Congress will take place on September 20-22, 2022 in Tomaszowice near Krakow. It is a continuation of two conferences: Geoengineering in Construction and Underground Construction that have been organized by Wydawnictwo Inżynieria for over many years.

The aim of the Congress is to present the nuances of infrastructural implementations, as well as to enable a wide discussion between all parties of the investment process. The event will be attended by representatives of general contractors, investors, producers, suppliers and design offices. Speakers, both from the world of science and companies, will share their knowledge and valuable industry experience with the audience during two congress days: the first will be devoted to geotechnical topics, and the second to tunnel projects and underground garages.

The event will be held in a hybrid formula: it will be possible to participate in it directly in Tomaszowice near Krakow and online via the AkademiaInzynieria.com platform.

Details about the event can be found on the Congress website:
